RAAD

COMPONENT FOR
ELECTRICAL CONNECTION
TECHNOLOGY

Confidence in Connection

The Company

We make confidence;

Raad offers confidence to his clientele, and this is not treated as a single slogan but as our aim and belief.

Over 26 years of experience and endeavor has helped us to design, expand, produce, and vend a vast range of products, from terminal blocks to measurement equipment, and from wiring ducts and Din rails to other components for electrical connection technology, and thus meeting our customers' needs quite properly.

Product approvals create trust;

Raad's products' quality certificates are the proof of high quality of these products. Raad Products have attained certificates from institutions like TSE, VDE, and DEKRA (KEMA), guaranteeing the products compatibility with international standards, and are suitable for potentially explosive atmospheres (ATEX Directive).

RAAD global market;

Replying to clientele's needs as well as supporting them is one of our commitments. Raad as the pioneer and leading producer in the Iranian domestic market and Middle East, and thanks to his 40 representatives and sales agents, has had efficient exports to global markets as well.

Raad Manufacturing Co. reserves the right to make changes to any information given in this catalog regarding technical progresses.

Please contact us for update technical information and new prices.

Screw Connection

This is the most popular of all known methods of connection. No other connection method allows such high contact forces to be produced in such a small space as a screw. Raad terminal block screw connection is easy to operate with a standard screwdriver or allen wrench, suitable for all types of conductors without special preparation, absolutely gas tight and vibration proof.

Reliable Clamping

Most Raad products use a clamping unit system which has been proven millions of times, world-wide. The clamping units as well as clamping screws are produced from hardened steel. When the clamping screw is tightened, the resultant force causes the upper thread overlap to spring open, thus causing a locking action to be exerted on the screw and an excellent resistance against vibration is achieved.

Push-In Connection

Raad push-in clamps, characterized by the simple handling and tool-free connection method. This allows you to push in the solid conductors (no preparation needed) and flexible cables (with using ferrules) and ensures confident connection by opening the contact spring automatically after the cables are pushed into the clamp. This kind of connection is vibration proof.

Clamp Connection

Single Level Terminal Blocks

Raad offers the RTP series with the following advantages:

- Combination foot for TH35 mounting rails
- Terminal insulation body polyamide 6.6
- Easy to tighten by screwdriver
- Closed cable entry for preventing from wire splitting
- Best connection of the conductor, needing no special cable preparation
- Appropriate for different cross-sections of cables, rigid or flexible
- Similar end plates and partition for several types
- Pre-assembled and divisible cross-connection system and easy removable unwanted cross-connection
- Offering protective conductor terminals, suitable for various sizes of terminals
- Having 10 marker strips simultaneously mountable on some sizes of the terminal

High current Terminal Blocks

- The RTB series are developed to have safe connection of high current carrying conductors in 70, 95,150,240 (mm²) sizes.
- Mountable on TH35-7.5,15 Rail profile in accordance with IEC60715.
- The insulating material is PA6.6, high grade fire resistant. (UI 94)
- Safety from finger touch of live parts by using its supplied special covers.
- Isolation cover can be managed to fit different cable lugs.

Protective Conductor Terminal Blocks

- Mountable on both TH35 and G32 mounting rails, beside other types of terminals
- Having green - yellow, partially insulated, cases made of polyamide 6.6
- Designed to provides proper electrical and mechanical connection with its mounting rail, so that it can be used as a protective conductor busbar
- Protective conductor terminal blocks share the same space-saving characteristics and design specifications as the RTP series
- Used for connecting PE and PEN conductors, regarding the rated cross - section to be more than 10 mm² for PEN function, as specified in the table below
- easy assembling on rail in new series RETN

Table A.1 - Maximum short - time withstand currents allocated to the rail profile and thermal rated current of a PEN busbar

Double / Three Level Terminal Blocks

This section consists of double-level (DRTP2.5/4, DRTP4-Series) and three-level (TRTP4) terminal blocks.

Raad double level terminal blocks enjoy the space-saving advantage. It is remarkable in DRTP4 that due to its double wiring density, the upper level is offset laterally by half of the terminal block width and the following advantages are met:

- Accessibility of the lower level screw is more effective with a screw driver and,
 - Lower labels and entry points can be viewed better
- The end plates, EP1, EP2, EP3 compensates the level offset at the beginning and the end of the terminal strips, therefor standard terminal blocks can be directly aligned.
- As for foot connection, they can be mounted on TH 35 mounting rail.
- Terminal block type DRTP4-L, DRTP2.5/4-L has four accessible input/output connecting ports by an internally link between two upper and lower levels. These terminals can be used as distribute terminals same as one to three or one to two branches, in the equipotential circuits, They can also connected to adjacent terminals, through cross-connection in the lower level.

Example for rectifying purposes

Example for fine switching a DC load

Example for lamp test circuit

- In designing DRTP2.5/4, DRTP4, special capabilities are offered for installing electronic elements. Raad double level terminal blocks are used for voltage rectifying, monitoring, electronic elements, fine switching, and test circuits. Furthermore, a number of circuits, in which the terminals are applied, are offered (for details see diagrams as follows). Any other type of circuit is offered on request.

- The coloured options can be requested. Raad three-level terminal block was specially developed for space-saving wiring in 3 wired elements such as motors and sensors, e.g. phase-neutral-earth connection or positive-negative-earth / shield connection. Some of the circuits designed by using small components in the Raad double level terminal block (DRTP2.5/4, DRTP4) given as below:

Test Disconnect Terminal Blocks

In measuring, control and remote - controlled systems, test disconnect terminals are often installed.

A typical circuit can be considered for each of the above mentioned items. RST6, RSTU6, RSTP6, RSTN6, RST6, RTT6, accompanied by their relating accessories, can be mounted in all types of circuits specified in this field, including secondary circuits for current transformers.

Disconnect and Component Terminal Blocks

Disconnect and component terminal blocks can be used, in measurement and control systems.

With disconnect terminals the current can quickly and safely be cut to carry out essential maintenance.

The function of RDT4, in order to rapidly switching circuits has distinguished this type of terminal.

Furthermore RDT4-TS is characterized by test socket for measuring and monitoring circuits.

In addition to switching the circuits, RDT2.5-C accompanied by its relating accessories, can be used as diode terminal block in RDT2.5-CDC or fuse terminal block in RDT2.5-CFC (with or without LED indicator).

On customer requirements, the capability of mounting any other components such as resistor, capacitor, etc... on terminal blocks RDT2.5-C and RDT4 would be considered.

FUSE Terminal Blocks

In accordance with the electrical standards, all electrical equipment control systems and machines must be protected with fuse cartridges, thus fuse terminal blocks have been developed to meet requirements of these standards.

The technical data of the fuse terminal blocks, for the protection of electrical devices, is bounded to the application and the use of products.

The RFT5 type holds different segments: The base terminal block and the upper hinged-type fuse carrier.

The RFT5 type is equipped with a light indicator which signalizes when the fuse blows. Meanwhile the RFT5 terminal block can carry a spare fuse cartridge inside the terminal.

The terminal type RDT2.5-CFC (and RDT2.5-CFCLD) has the advantages of easy removing and replacing of the cap (and the fuse) as well as isolation of the fuse signal circuit from the terminal block base, when detaching the cap.

- Maximum power dissipation of fuse terminal blocks at 23°C (based on IEC 60947-7-3):

Type	Overload & short circuit protection		Exclusive short circuit protection	
	Separate	Compound	Separate	Compound
RFT5	1.6 watt	1.6 watt	4 watt	1.6 watt
RDT2.5-CFC	2.5 watt	1.6 watt	4 watt	2.5 watt

Push-In Connection Terminal Blocks

Tool-free cable placing technology in Raad push-in terminal blocks, characterizing this type of terminals by the following advantages:

- Direct inserting of solid conductors or any prepared cables with ferrules (no tools needed).
- Easy release of conductors by the plastic actuation lever with using any type of tools without connecting live parts.
- Space-saving design, optimized handling and easy assembling.
- Easy insertion of conductors by a little pushing force.

Earth Push-In Protective Terminal Blocks

Some of the most practical advantages of using RAAD push-in protective earth terminal blocks have been listed below:

- Significant time and cost savings
- Stainless steel spring continuously providing the necessary contact force between conductor and current carrying part
- Compact construction and high-performance contact technology
- Insulation housing made of high grade fire resistant PA6.6
- Safe and tool-less connecting
- Mountable on TH35 mounting rail
- Easy release of conductor by using any type of tools

Multi-Level Push-In Terminal Blocks

RAAD Multi-Level Push-in Terminal Blocks are manufactured to:

- Have a neat design, which saves you space.
- Be suited, exclusively, for 1 or 3-phase load connection.
- Be easy access and independent levels.
- Resist fire due to material, PA6.6.
- Have a high standard locking mechanism in its clamps.
- Be compatible with small accessories.
- Comply with IEC 60947-7-1.
- Be safe and less consuming due to its tool-less connection.
- Be mounted on TH 35 rails.

Multi-Conductor Push-in Terminal Blocks

RAAD Multi-Conductor Push-in Terminal Blocks are manufactured to:

- Resist corrosion, due to its high grade material.
- Contain reliable solution for multiple wire connections.
- Meet the specifications and strict requirements of IEC 60947-7-1 standard.
- Offer space-saving alternative for high density wiring.
- Easily snap onto the DIN rail, TH 35, to make a reliable mechanical contact.
- Enable solid and stranded conductors to be connected without any tools.
- Resist fire due to material, PA6.6.
- Comply with a comprehensive range of accessories, marking and bridging.

Transformer Terminal Blocks

- RAAD transformer terminal blocks with nominal cross section 4mm² and operating voltage 800V are made in accordance with IEC 60947-7-1.
- Flame proof material PA6.6, flammability class V2.
- Can be fit insulating cover.
- No need for special preparations.
- Easy to mark.

Strip Series Terminal Blocks

The Strip terminals can be used for household and similar purposes, with direct mounting.

- The types RMT2.5 and RMT6 strip terminals have the benefit of double modules, “which can be mounted with any required strips by sliding fitting.”

- The similar height for RMT2.5 and RMT6 has distinguished these types of terminals, due to make adjacent terminal blocks in different sizes with unit height, by tightening their bodies together.

EX Series Terminal Blocks

Terminal blocks for Potentially Explosive Atmosphere and Hazardous Location (ATEX-Directive 94/9/EC).

Now, Raad Terminal Blocks can be used in potentially explosive environments.

To assure such capability, various tests, namely as corrosion test, mechanical test and vibration test as well as ordinary tests are conducted on the terminal blocks.

All in all, IEC 60947-7-1, IEC 60947-7-2 and IEC 60947-7-3 standards pinpoint various mechanical, electrical and thermal requirements. Compliance with the mentioned standards is certified by an authorized certification body, granting product certificate.

Further to these standards, requirements of EN 60079-0, EN 60079-7, EN50281-1-1 or IEC 61241-1 standards as well as ATEX-Directive 94/9/EC are taken into consideration by an EU ATEX Notified Body in order to assure products capability to be used in potentially explosive environments.

These terminal blocks, were subjected to shock and vibration tests in accordance with the standards IEC/EN 60068-2-6 and IEC/EN 60068-2-27 respectively, carried out by TUV product service.

Consequently, the obtained certificates are "EC-TYPE Examination Certificate" on Products and "Production Quality Assurance Notification" on quality management system, proving the fact that the products can be applied in potentially explosive environments.

In ATEX-Directive 94/9/EC certificate, terminal block belongs to components category, meaning that they must be applied in approved connection boxes for type of protection "e", increased safety, having no need to be printed with CE.

Instruction for safe installation and assembling

The Raad Ex-terminal blocks are mountable on EN 50022, EN 50035, IEC60715, G32, TH35-7.5 and TH35-15 mounting rails.

When using Ex terminal blocks and accessories, the attention should be drawn towards clearances and creepage that have to be met.

When cross-connections or bridges are used, a partition plate is necessary between connections as well as at the beginning and end of each connection.

On the other hand, equipotential zones that were made due to applying cross-connections must be separated by means of partition plates.

Intended area of use and operation conditions

The ATEX Directive 94/9/EC ANNEX I defines levels of protection for various categories of equipment as follows:

Level of Protection	Category		Performance of Protection	Conditions of Operation
	Group I	Group II		
Very High	M1		Two independent means of protection or safe even when two faults occur independently of each other	Equipment remains energized and functioning when explosive atmosphere present
Very High		1	Two independent means of protection or safe even when two faults occur independently of each other	Equipment remains energized and functioning in Zones 0,1,2 (G) and /or 20,21,22 (D)
High	M2		Suitable for normal operation and severe operating conditions	Equipment de-energized when explosive atmosphere present
High		2	Suitable for normal operation and frequently occurring disturbances or equipment where faults are normally taken into account	Equipment remains energized and functioning in Zones 1,2 (G) and /or 21,22 (D)
Normal		3	Suitable for normal operation	Equipment remains energized and functioning in Zones 2(G) and/or 22(D)

Depending on the maximum surface temperature of the equipment, the electrical equipment of group II is limited in temperature classes T1 up to T6.

Classification of maximum surface temperatures for group II electrical apparatus.

Temperature Class	Maximum Surface Temperature(°C)
T1	450
T2	300
T3	200
T4	135
T5	100
T6	85

Electrical equipment shall normally be designed for use in the operating temperature range between -40°C and +80°C. If the real ambient temperature is higher, the permitted operating current must be reduced accordingly.

Raad terminal blocks for the type of protection-increased safety “e” are generally chased in T6. When using RAAD terminal blocks in electrical apparatus of temperature classes T1 up to T5 the highest temperature of the insulating parts shall not exceed 85°C.

Characteristics of tools which may be used with the equipment

All Raad Ex-screw terminal blocks should be used with a proper universal screw driver or allen wrench. No special tool is required.

NS5 Terminal width = 5mm

NS6 Terminal width = 6mm

NS6.4 Terminal width = 6.4mm

NS8 Terminal width = 8mm

NS10 Terminal width = 10mm

The NS type Marking tags

This type of labeling meets the advantage of easy and quick handling. The NS sheets consist of white polyamide with black printings. The sheets are labeled horizontally with maximum 3 characters, easy to read and high-contrast. The hot impressed black printings are absolutely wiping resistant. One NS sheet consists of 5 strips, includes 10 single tags that can be simply pushed into the label slots of the terminal blocks. The NS sheets can be divided at any point and can be manually labeled with ease.

Size

The push-on tags of NS marking system can be requested in any of the following sizes with or without printed characters.

- 1) NS5, used for terminal block width 5 mm.
- 2) NS6, used for terminal block width 6 mm.
- 3) NS6.4, used for terminal block width 6.4 mm.
- 4) NS8, used for terminal block width 8 mm.
- 5) NS10, used for terminal blocks width 10mm or more.

End Plates and Partitions

(P)

End Plate (EP)

The last terminal in a row must, in most cases, be covered with an end plate. Within one terminal strip, composed of various terminal sizes, end plates should also be interposed. The end plate external dimensions correspond to the core dimensions of the attendant terminal. The end plates are held by an end bracket.

(SP)

Partition (P)

Depending upon the operating voltage, a partition must be fitted next to cross-connection groups, so that the necessary clearance and creepage distance can be maintained.

(GP)

Small Partition (SP)

Space-saving partitions can be post-fitted between cross-connections for terminal blocks.

General Partition (GP)

These types of partitions serve for RTP16-50.

(CB/1)

Cover Base (CB\1)

To safety from finger touch of live parts for electrical components, type of insulated covers can be used and mounted on CB\1.

* Applicable for all terminal blocks with exception RTP95,150, RST6, RTT6.

Cross-Connections

For cross-connection bar, connection sleeves and screws are already captively mounted with the corresponding number of poles. The cross-connection then only requires inserting in the individual terminal row when fitting.

The cross-connection unit is supplied in 2, 3 and 10 poles.

Easy to cut the insulated body of terminal blocks by nose plier or cutting tools in order to use rapidly jumping systems, is distinguished Raad terminal blocks. This method can be used for types: RST6, RSTT6, TRTP4,...

Cross-Connection Bar (CC)

To handle cross-connection of several terminal blocks, with the same potential, copper cross-connection bars are used. These cross-connection bars supplied in 2, 3 and 10 poles; and their length are equal to the individual terminal width. The cross-connection bar is electrically joined through a connection sleeve to the terminal block busbar.

Connection Sleeve and Screw

The length of the brass connection sleeve is matched to the individual terminal. In order to be able to connect the cross-connection bar and the connection sleeve to a terminal block busbar, a brass screw is applied. The cross-connections are designed so that where a terminal does not need any cross-connection; it is possible to remove the screw and its sleeve, thus no cross-connection occurs in the terminal.

Bridge Comb (BC)

This type of cross connection is consisted of plastic (PA6.6) and copper parts and meet the best connection between the same voltage level of various terminal blocks, needing no special tools. This type of cross-connection in 2, 3, 10 branches/poles are available based on request.

Bridge Screwless (BS)

Confidence in connection attained by using copper for metal parts of BS. This type of jumpers can be used for Raad screwless terminal block types: RTS, RPIT.

Fuse-Switch Disconnectors

Protecting devices used in electrical circuits, from overload and short circuit is inevitable.

To meet the needs of the most demanding customers, Raad manufacturing co., has recently produced new type of products suitable for disconnection and switching, in accordance with international standards.

Raad fuse switch-disconnector introduces a new level of safety, special for 10.3x38, AC fuses.

The design of Raad fuse- holders, in compliance with the IEC 60947-3 standard, has distinguished this type of product for switching under load, to ensure protection from any undesirable damaging currents.

RFH10, is mountable on TH 35-15, TH 35-7.5 DIN rails in accordance with IEC60715 and make high level of finger touch protection, while changing fuses.

Utilization of durable self-extinguish thermoplastic material with extra resistance to high current in body of RFH10 and on the other hand silver plated copper for its contact is strong proof to evidence the quality of this product.

Raad fuse holders are available in 1, 2, 3 or 4 poles; with or without LED-indicator. Multi-pole units can be also assembled by using of special accessory introduced as in next pages.

Easy installing and high level of protection

The design of RFH10 is space-saving and allows you to easily insert or replace fuses by flipping the hinge of knob.

RFH10 has safety design for finger-touch protection and not accessible to live parts, in accordance with international protection standards.

Detecting the defective phase and blown fuses is simply achieved by indicator light LED.

RFH10, securely protection of electrical circuits

Using Raad fuse holders, is a secure solution for circuit isolating from short circuit and overload.

Due to AC-22B utilization category, according to IEC60947-3 standard, RFH10 is designed for switching under load and protection.

This product can be used in automation

switchboards for switching of mixed resistive and inductive loads; so protection of control circuits, primary and secondary of transformers, motors and other resistive or inductive loads is advantages of using RFH10.

Definition and Characteristics

Disconnecter

Mechanical switching device which, in the open position, complies with the requirements specified for the isolating function.

Compliance to international standards, any maintenance operations on installation are prohibited unless circuits have been previously disconnected.

Fuse-disconnector

Disconnecter in which a fuse-link or fuse-carrier with fuse-link forms the moving contact. Refer to this definition not all of the fuse holders are disconnecter, so they must meet the requirements of IEC60947-3 standard.

Fuse-switch-disconnector

Switch-disconnector in which a fuse-link or fuse-carrier with fuse-link forms the moving contact. Refer to this standard definition, and utilization category of AC22-B identified in next clause, a fuse-switch-disconnector with these characteristics can be switched under load.

Utilization Categories

IEC 60947-3 Utilization Categories (Table2)			
Nature of current	Utilization categories		Typical applications
	Category A	Category B	
Alternating current	AC-20A ^a	AC-20B ^a	- Connecting and disconnecting under no-load conditions - Switching of resistive loads including moderate overloads - Switching of mixed resistive and inductive loads, including moderate overloads - Switching of motor loads or other highly inductive loads
	AC-21A	AC-21B	
	AC-22A	AC-22B	
	AC-23A	AC-23B	
Direct current	DC-20A ^a	DC-20B ^a	- Connecting and disconnecting under no-load conditions - Switching of resistive loads including moderate overloads - Switching of mixed resistive and inductive loads, including moderate overloads (e.g. shunt motors) - Switching of highly inductive loads (e.g. series motors)
	DC-21A	DC-21B	
	DC-22A	DC-22B	
	DC-23A	DC-23B	

^a The use of these utilization categories is not permitted in the USA.

Refer to circumstance of situations, the AC22-B utilization category can be operated of mixed resistive and inductive loads with moderate overloads. Mixed load consist of: Transformers, corrected motors, capacitor batteris, discharge lamps, heating, etc.

In the following, we offer some of the safety standard fuse-link to use in RFH10:

Wiring Duct Systems And Components

As part of the business development efforts, Raad Manufacturing Co. is now in a position to offer high quality "WIRING DUCTS" to customers.

These series of wiring ducts, feature as an excellent assembly and are ideal for any type of power and control panels preferably for control panels where performance remains unaltered over time even under the heaviest operating conditions.

The reliability and durability of these products is guaranteed by a very severe selection of raw materials employed for their production and rigorous process controls.

Correct installation by qualified staff, as well as proper use and periodical maintenance contribute to the safety and safeguarding of people and property.

Note:

The word "duct" utilized in this catalog, if any, is used as a popular expression in industries, and the word "trunking" shall be considered instead as a right word, in accordance with definitions in the related standards.

Construction Specifications

- Slotted wiring duct for installation in cabinets based on standards EN 50085-1+A1 and EN-50085-2-3 (IEC 61084-1+A1).
- The base perforation of the wiring duct allows mounting on the panel or on Din mounting rails.
- Duct material as Rigid PVC, self-extinguishing (non-flame propagating) and resistant to abnormal heat and fire up to 960°C (glow-wire test) in conforming with IEC/EN 60695-2-11 standards.
- Product without Lead (Pb) in accordance with RoHS requirements.
- Technical characteristics of PVC duct as shown in Table 5.
- Complementary construction details as illustrated in Figures 1 to 5.
- Duct dimensional details, as shown in Figures 6 and 7.
- Nominal sizes and dimensions as shown in Table 1.
- The thickness of wall, bottom and cover as shown in Table 4.
- Standard length as 2 meters.

OPERATING INSTRUCTIONS

- The maximum application (operating) temperature as +60°C in accordance with IEC/EN standards.
- The minimum storage/ transport temperature as -45°C.
- The minimum installation/ application temperature as -25°C.
- The number of conductors must not exceed the recommended values, considering 60% stuffing coefficient (Table 2).
- Suitable for small sized wires employed in electric and electronic control panels.
- The deformation of horizontal duct walls under recommended conductor loading has been subjected to limited investigation. The acceptability of deformation under more rigorous conditions such as load bearing cover or required mechanical spacing must be evaluated in the end-use investigation.

Slotted Wiring Ducts

Type: RWD 

- High quality products conforming to international standards.
- Designed to meet the needs of panel builders regarding to advanced and time-saving panel assembling.
- Complying with international certificates KEMA, CE.

Figure 1

- Two predetermined break lines for breaking off and removal of sidewall finger segments only as well as removal of sidewall finger and base segments.

Figure 2

- The possibility of making different distinct levels, by using special pins inside the holes contrived in the duct fingers. It is mentionable that ducts with the height up to 40 (mm), have only one hole in the middle, while for duct height including 60 (mm) and more, two holes provide the above - mentioned possibility.

Figure 3

- Provided with a soft yellow PVC strip for handling purposes to avoid hand-accidents during the cabling as well as making the cover very steady.

Figure 4

- Non-slip covers design of minimum encumbrance and maximum grip.

Non-slotted Wiring Duct

Type: HWD

Using RAAD Household Wiring Duct (HWD) makes your room look more appealing by hiding and safely storing the wires that go across walls, ceilings and floors. HWDs are widely used in buildings, offices, houses and residential properties, just to name a few. Using the HWDs will provide your wires with an appropriate casing, helping you to place your cables into pre-determined paths. This product comes with a cover to simplify the process of purchasing. The use of heat-resistant PVC avoids any damage caused by the heat-emitting equipments.

Din Rail Socket Outlet

Using Socket in electrical cabinets and power distribution systems is unavoidable.

The capability of Raad Socket outlet in mounting on din rails as well its standard format, distinguished this type of product. The main connection terminals (L1, N, PE) are arranged on one side of the socket for easy connection.

The advantages of DSO are as follows:

- Mountable on TH35-15 and TH35-7.5 din rails in accordance with IEC/EN 60715.
- Having three connection terminals: phase-neutral-earth.
- With and without light indicator (LED)
- Applied UI 94 high grade fire- resistant plastic material.
- The sockets are supplied with marking tags.

Control switches

The range of 22mm diameter push buttons is designed in accordance to IEC 60947-5-1 and IEC 60947-5-5 to provide the following features:

- Easy and rapid installation
- Fixing method unaffected by excessive vibration
- Produced from flame resistant material
- Plastic bush construction resistant to corrosion and longer mechanical life
- Independent assembling of NC and NO contacts and freely combined for convenient replacement
- Outstanding appearance and ergonomics
- The BA9S lamp can be requested in each color

Mounting Rails And Accessories

IEC 60715 mounting rails form the basis for the mounting of modular terminal blocks, as well as for rail mountable electro technical and electric components. Active and passive components are installed on mounting rails. In control cabinet design, the TH 35-15, TH 35-7.5 and G32 rails stand out with their high degree of dimensional accuracy and surface tempering. All steel versions are electroplated and additionally coated with a white chromate comply with the IEC 60715, EN50022, EN50035 standards. Raad supplies components which are totally co-ordinated in their functionality.

The mounting rails can also be used as a protective busbar. Raad protective conductor terminals meet the requirements specified in IEC 60947-7-2.

The rails are both produced in slotted and non-slotted form for easier application by the users.

Description	Type	Ordering No.	Qty.
Mounting Rail In according to IEC 60715, EN50022, EN50035, White chromated, length 2m, Slotted	TH 35-7.5/S	6090101002	20
Mounting Rail In according to IEC 60715, EN50022, EN50035, White chromated, length 2m, Slotted	TH 35-15/S	6090102002	10
Material	Steel, galvanized & White chromated		

Mounting Rail Accessories

Mounting Rail Support

Angled Rail supports (ARS) hold sloped attachment of mounting rails at an angle of 35°. Their designs are available with M6 threads.

Flat mounting rail supports (FRS) are similar to ARS, but with flat surface.

Description	Type	Ordering No.	Qty.
Angled rail support allow for sloped attachment of mounting rail at an angle of 35°, with M6 thread	ARS/M6	6090202001	10

Confidence in Connection

Certificates

Achieving a uniform quality on production in mass production is impossible unless through establishment of quality management system. Having the certificate of quality management system in accordance with ISO 9001:2008 issued by authorized and well-known standard institutions, Raad Manufacturing Company is seeking to assure its customers for the existence of such system.

Furthermore, Raad products quality is proven by outstanding institutions, being well-known in electric field all around the world, offered various types of certificates, in accordance with 2006/95/EC LV Directive.

Both, the certificates of products quality and quality management system indicate reliable products, manufactured by the company. The development plan to gain other certificates on products quality and quality management system is still alive and continuing.

Material

Raad products use parts and materials conform to standards in electrical industry and are subject to quality control system.

Metals

All metal parts in Raad products are electro-plated using the latest state of the art engineering methods.

The surface protection conforms to technical standards. Steel parts at the beginning are zinc-plated and then a white chromate layer coats over the zinc, providing the best possible passivation.

Copper and brass parts are tin-plated. Tin plating provides excellent protection against corrosion and has good electrical conduction.

Insulating Materials

Raad terminal blocks use thermoplastics for insulating materials.

Thermoplastics are processed using economical and environmentally healthy injection molding processes, and have good recycling properties and can be reused. Polyamide 6.6 is a thermoplastic, used in the insulation body of Raad products. This modern semi-crystalline material has excellent electrical, mechanical, chemical and other characteristics even at 100°C for continuous operating.

The short-time peak temperatures are permissible up to about 200°C and the melting point is around 260°C.

Polyamide 6.6 absorbs moisture from its surroundings, on average 2.8 %. This makes the PA 6.6 more flexible and resistant to breakage, even at -40°C. Today PA 6.6 is approved for use by the approval authorities such as CSA, NEMKO, KEMA, PTB, SEV, UL, VDE, etc.

Properties	Standard	Unit	PA 6.6
Max. application temperature (RTI)	IEC60216-1	°C, <5000h °C, <20.000h	125 100-130

Terminal block tests

IEC 60947-7-1 is the main standard which meets all types of Raad terminal blocks. All Raad products are designed, manufactured and tested in accordance with the standard, which along with IEC 60947-1 determines the tests to be conducted on terminal blocks, each as a type test. Tests details are specified in the standards. Below is an abstract of the foregoing tests.

Attachment of the terminal block to its mounting rail

To assure the stability of the terminal block to its mounting rail, with standard shape and dimension values, a relevant test is conducted by inserting a 150 mm long steel pin with a diameter specified in table 3 of IEC 60947-7-1. It is connected to each clamping unit and a tightening torque must be applied, as given in table 4 of IEC 60947-1. Force must be applied to the pin with regular intensity and without tears; the corresponding value must be taken from table 3 of IEC 60947-7-1. The distance between the application point of the force and the centre of clamping unit must be equal to 100 mm. During the test, no terminal block must disengage from its mounting rail or suffer any damage.

IEC 60947-7-1 Attachment test parameters (Table3)			
Rated cross-section of terminal block		Force	Diameter of pin
mm²	AWG/kcmil	N	mm
0.2	24	1	1.0
0.34	22		
0.5	20		
0.75	18

150	300kcmil		
185	350kcmil		
240	500kcmil	20	20.5
300	600kcmil		

Mechanical strength of terminals

To handle this test on screw-clamp terminal blocks, the rigid conductors must be used, which have the rated cross-section stated by the manufacture. The conductors must be connected and disconnected five times depending

on the screw clamping, as determined in table 4 of IEC 60947-1. Where a screw is loosened, a new conductor must be applied. During the test, clamping units shall not work loose and there shall be no damage that will impair the further use of the screwed connections.

IEC 60947-1 Tightening torques for the verification of the mechanical strength of screw-type terminals (Table4)				
Diameter of thread mm		Tightening torque N.m		
Metric standard values	Range of diameter	I	II	III
1.6	£1.6	0.05	0.1	0.1
2.0	>1.6 up to and including 2.0	0.1	0.2	0.2

20	>20 up to and including 24	-	-	36.0
24	>24	-	-	50.0
Column I	Applies to screws without heads which, when tightened, do not protrude from the hole, and to other screws which cannot be tightened by means of a screwdriver with a blade wider than the root diameter of the screw.			
Column II	Applies to nuts and screws which are tightened by means of a screwdriver.			
Column III	Applies to nuts and screws which can be tightened by means other than a screwdriver.			

Damage and accidental loosening of conductors-flexion test

Specifically, this test is applied on terminal blocks suited for the connection of unprepared round copper conductors. It is a must to test both rigid and flexible conductors with min. and max. cross-sections; optionally, connections of multiple conductors to a single clamping unit. A particular test apparatus is considered to aid the test performance. During the test, neither must the conductor slip out of the clamping unit, nor does breakage occur near the clamping unit. Soon after the flexion test, a pull-out test must occur without restoring the initial tightening torque.

Pull-out test

After the flexion test was conducted, a pull-out is carried-out by force, the value of which is presented in table 5 of IEC 60947-1 to the conductor attached to the clamping unit; this force must be applied regularly and without tears, for 1 minute; for screw-clamp terminal blocks, the tightening screws must not be newly tightened. During the test, neither must the conductor slip out of the clamping unit, nor does breakage occur near the clamping unit.

IEC 60947-1 Test values for flexion and pull-out tests for round copper conductors (Table5)					
Conductor cross-section		Diameter of bushing hole ^{a,b}	Height H ^a	Mass	Pulling force
mm²	AWG/kcmil	mm	mm	kg	n
0.2	24	6.5	260	0.2	10

240	500kcmil	28.6	464	20	578
300	600kcmil	28.6	464	22.7	578
a)	Tolerances: for height H ± 15 mm, for diameter of the bushing hole ± 2 mm.				
b)	If the bushing hole diameter is not large enough to accommodate the conductor without binding, a bushing having the next larger hole size may be used.				

Rated cross-section

It is the value of max connectable conductor cross-section. The rated cross-section shall be selected from the standard cross-sections presented in table 1, IEC 60947-1. Where a ferrule is applied on a flexible conductor, then a terminal block of one step higher rated cross-section must be used, for example, a 2.5mm² flexible conductor covered with the relating ferrule must be inserted to a one step higher cross-section, i.e. terminal block with rated cross-section 4mm².

IEC 60947-7-1 Standard cross-sections of round copper conductors and approximate relationship between mm² and AWG/kcmil sizes (Table1)		
Rated cross-section mm²	AWG/kcmil size	Equivalent metric area mm²
0.2	24	0.205
0.34	22	0.324
0.5	20	0.519

-	0000	107.2
120	250kcmil	127
150	300kcmil	152
185	350kcmil	177
-	400kcmil	203
240	500kcmil	253
300	600kcmil	304

NOTE: The dash, when it appears, counts as a size when considering connecting capacity (see 7.1.7.2).

Rated connection capacity

It is the range of cross-sections and the number of connectable conductors based on which the terminal blocks are designed. The IEC 60947-7-1 determines the relation between the rated cross-section and rating connecting capacity of terminal blocks. Practically, terminal blocks up to 35mm², must be possible to connect a conductor of cross-section equal to the nominal cross-section and lower up to two cross-sections.

Insulation coordination for equipment within low voltage systems

IEC 60664-1 deals with insulation coordination for equipment within low voltage systems. It specifies the requirements for clearances, creepage distances and solid insulation for equipment based upon the performance criteria. Terminal blocks standard, IEC 60947-7-1, has the rules for coordination of insulation in accordance with IEC 60664-1.

Clearances

Degrees of pollution in the micro-environment

● **Pollution degree 1**
No pollution or only dry, non-conductive pollution occurs. The pollution has no influence.

● **Pollution degree 2**
Only non-conductive pollution occurs except that occasionally a temporary conductivity caused by condensation is to be expected.

● **Pollution degree 3**
Conductive pollution occurs or dry non-conductive pollution occurs which becomes conductive due to condensation which is to be expected.

● **Pollution degree 4**
The pollution generates persistent conductivity caused by conductive dust, rain or snow.

Overvoltage categories

- Equipment of overvoltage category I is equipment for connection to circuits in which measures are taken to limit transient overvoltages to an appropriately low level. Examples for such devices are protected electronic circuits.
- Equipment of overvoltage category II is energy-consuming equipment to be supplied from the fixed installation. Examples of such equipment are appliances, portable tools and other household and similar loads.
- Equipment of over voltage category III is equipment in

fixed installations and for cases where the reliability and the availability of the equipment are subject to special requirements. Examples of such equipment are switches in fixed installation and equipment for industrial use with permanent connection to the fixed installation.

- Equipment of overvoltage category IV is for use at the origin of the installation. Examples of such equipment are electricity meters and primary over-current protection equipment

EN 60664-1						
Rated impulse voltage for equipment energized directly from the low-voltage mains (Table1)						
Nominal voltage of the supply system based on IEC 60038 ²⁾ V		Voltage line to neutral derived from normal voltages a.c. or d.c. up to and including V	Rated impulse voltage ¹⁾ V			
Three phase	Single phase		Over voltage category			
			I	II	III	IV
		50	230	500	800	1500
		100	500	800	1500	2500
	120-240	150	800	1500	2500	4000
230/400 277/480		300	1500	2500	4000	6000
400/690		600	2500	4000	6000	8000
1000		1000	4000	6000	8000	12000
1) Equipment with these rated impulse voltages can be used in installation in accordance with IEC60364-4-443.						
2) The / mark indicates a four-wire three-phase distribution system. The lower value is the voltage line -to- neutral, while the higher value is the voltage line-to-line. Where only one value is indicated, it refers to three-wire, three-phase systems and specifies value line-to-line.						

IEC 60947-1								
Minimum clearance in air (Table13)								
Rated impulse withstand voltage Uimp kV	Minimum clearances mm							
	Case A Inhomogeneous field conditions (see 2.5.63)				Case B Homogeneous field ideal conditions (see 2.5.62)			
	Pollution degree				Pollution degree			
	1	2	3	4	1	2	3	4
0.33	0.01				0.01

8.0	8	8	8	8	3	3	3	3
12	14	14	14	14	4.5	4.5	4.5	4.5

NOTE: The values of minimum clearance in air are based on 1,2/50 ms impulse voltage, for barometric pressure of 80 kPa, equivalent to normal atmospheric pressure at 2 000 m above sea level.

Creepage distances

The creepage distance is based on the rated voltage which is derived from the working voltage or nominal voltage of the supply system. The minimum creepage distances are allocated to the rated voltage according to the pollution degree and material group in table 15, IEC 60947-1.

In this catalog the products must be measured in compliance with IEC 60664-1 for overvoltage category III, pollution degree 3 and material group I, otherwise the product information would include additional details.

IEC 60947-1															
Minimum creepage distances (Table15)

1) Material groups I, II, IIIa, IIIb.
2) Material groups I, II, IIIa.
3) Values of creepage distances in this area have not been established. Material groups IIIb is in general not recommended for application in pollution degree 3 above 630 V and in pollution degree 4.
4) As an exception, for rated insulation voltages 127 V, 208 V, 415/440 V, 660/690 V and 830 V, creepage distances corresponding to the lower values 125 V, 200 V, 400 V, 630 V and 800 V respectively may be used.
5) The values given in these two columns apply to creepage distances of printing

circuit materials.
6) The values of creepage distances stated for 250 V can be used for 230 V (±10 %) normal voltage.
NOTE 1 It is appreciated that tracking or erosion will not occur on insulation subjected to working voltages of 32 V and below. However, the possibility of electrolytic corrosion has to be considered and for this reason minimum creepage distances have been specified.
NOTE 2 Voltage values are selected in accordance with the R₁₀ series.

Dielectric test

The test is conducted on 5 adjacent terminal blocks, mounted on a metallic mounting rail and connected with rated cross-section conductors.

Test voltage must have a sinusoidal waveform with a frequency between 45 and 62 Hz.

The values applied, for 5 seconds, are those specified in the table 12A, IEC 60947-1. Irrespective of glow discharges without drop of voltage, no disruptive discharges shall occur during the test.

IEC 60947-1 Dielectric test voltage corresponding to the rated insulation voltage (Table 12A)		
Rated insulation voltage U_i V	AC test voltage (r.m.s.) V	DC test voltage ^{2), 3)} V
$U_i \leq 0$	1000	1415
$60 < U_i \leq 300$	1500	2120
$300 < U_i \leq 90$	1890	2670
$690 < U_i \leq 800$	2000	2830
$800 < U_i \leq 1000$	2200	3110
$1000 < U_i \leq 1500^{1)}$	-	3820

1) For d.c. only.

2) Test voltages based on 4.1.2.3.1, third paragraph of IEC 60664-1.

3) A direct current test voltage may be used only if an alternating test voltage cannot be applied. See also 3) b) ii) of 8.3.3.4.1.

Short-time withstand current

The standard IEC 947-7-1 obliges terminal blocks to withstand a current equal to 120A per each square mm of rated cross-section for 1 second.

Voltage drop

Voltage drop at the terminal indicates an index of contact resistance against the follow of current. The voltage drop test is conducted before and after mechanical strength, short-time withstand current and temperature-rise tests. IEC 60947-7-1 states that the voltage drop, measured on a new terminal block, must be lower than 3.2 mV and after the tests lower than 150 % of the value measured before the tests.

Temperature-rise test

The current in a terminal block causes overheating due to continuous operation. The overheating level shall not overcome a specified value, thus a temperature-rise test is applied to verify this performance requirement. The test is conducted by means of temperature-rise test on 5 neighboring terminal blocks connected at a test current as specified in table 4, IEC 60947-7-1. The temperature-rise of any part of the centrally located terminal block shall not exceed 45 K.

IEC 60947-7-1 Values of test current for temperature-rise test, ageing test and voltage drop test for metric wire sizes (Table 4)			
Rated cross-section mm ²	Test current A	Rated cross-section mm ²	Test current A
0.2	4	25	101
0.5	6	35	125
0.75	9	50	150
1	13.5	70	192
1.5	17.5	95	232
2.5	24	120	269
4	32	150	309
6	41	185	353
10	57	240	415
16	76	300	520

Verification of thermal characteristics

The Thermal characteristics are checked by the needle flame test.

The test is carried out according to IEC60695-11-5 successively in the area of one clamping unit of three terminal blocks.

The test flame is applied to the surface of test specimen and removing after the specified time.

With no any glowing of the test specimen or extinguishing the sample within 30s, the test is passed.

Vibration and shock resistant

Shock Test

The purpose of this test is to reveal mechanical weakness and/or degradation in specified performances or accumulated damage or degradation caused by shocks.

The following test is done in accordance with required by the specifications: shock test to BS EN60068-2-27

Shock pulse: Half sine

Acceleration: 40g

Pulse duration: 6ms

Test directions: In all three major orthogonal axes

Number of shocks: 1000 in each axis

Total number: 3000

Vibration Test

The purpose of this test is to determine the ability of components, equipments and other articles to withstand any mechanical weakness and/or degradation caused by vibration.

The following test is done in accordance with required by the specifications: swept sine vibration to BS EN 60068-2-6

Frequency range: 55 Hz to 2000 Hz

Test levels: 55 Hz to 58.1 Hz: 1.5mm displacement peak to peak
58.1 Hz to 2000 Hz: 100 m/s² (10g)

Vibration directions: In all three major orthogonal axes

Duration: 10 swept cycles in each axis

Sweep rate: 1 octave/minute

Wiring Duct Tests

The following tests as type tests should be carried out for testing of wiring ducts in accordance with the main standards EN 50085-1 and EN 50085-2-3:

Check marking

Each system component shall be marked with:

- The manufacturer's or responsible vendor's name or trade mark or identification mark,
- A product identification mark, which may be, for example a catalog number, a symbol or the like.

Cable support test

Each test is made on one sample of slotted trunking length having a length of about 250 mm.

The sample is securely fixed to a rigid support. Then the sample is subjected to an evenly distributed load of 0.8 g/mm² for metre length of the declared usable area for cables.

The load consists of copper cables, half load cables of 25 mm² nominal cross section and other half cables of 2.5 mm² nominal cross section. This load is preserved for 2 h in climatic chamber to 60 °C.

After about 2 h, with the load still applied, the distortion shall not exceed 10% of the height with a maximum of 10 mm.

The Same result shall be obtained for the width.

Impact test for storage and transport

The test is carried out on the samples of trunking lengths each about 250 mm long.

Before the test, the samples are aged at the temperature of 70 °C for 168 h continuously.

The test apparatus consists basically of a hammer which falls freely from rest, through a vertical height on to an intermediate part placed on the sample held in a horizontal plane.

The mass of the hammer is 0.5 kg and the fall height is 100 mm.

The samples are placed in a refrigerator at the temperature of -45° C for 2 h.

Within 10 s after the removal of the sample from the refrigerator the hammer is allowed to fall so that an impact is applied to the centre of the cover or the centre of the bottom of the base .

After the test the samples shall show no signs of disintegration nor shall there be any cracks, that are likely to impair safety.

Insulation resistance test

Before the test, the sample shall be placed in the humidity cabinet with a relative humidity between 91% and 95% at a temperature maintained between 25 °C and 30 °C. The samples are kept in the cabinet for 120 h .

Immediately after conditioning, two conductive foils used as electrodes are applied, one to the outer surface and one to the inner surface of the sample .

The insulation resistance is measured by applying a d.c. voltage of 500 V between the electrodes.

The measurement is made 60 s after the application of the voltage.

The insulation resistance shall not be less than 100 MΩ.

Dielectric strength test

Immediately after the insulation resistance test, a voltage of (2 Un + 1000) V, where Un is the rated voltage of substantially sine-wave form and having a nominal frequency of 50 Hz, is then applied between electrodes. Initially not more than half the voltage is applied and then it is raised to the test voltage as rapidly as possible without transient over voltage.

The voltage is maintained for about 5 s.

No flashover or breakdown shall occur during the test.

Resistance to heat

The part under the test shall be placed on a 3 mm thick steel plate in direct contact with it so as to be supported to withstand the test force .

When it is not possible to carry out the test on the sample, the test shall be carried out on a piece of the same material with at least 2 mm thick .

The surface of the part to be tested is placed in the horizontal position and a steel ball of 5 mm diameter is pressed against the surface with a force of 20 N .

The test is carried out in a heating cabinet at the temperature of 70 °C.

After 1 h, the ball is removed from the sample which is then cooled down within 10 s to approximately room temperature by immersion in cold water.

The diameter of the impression caused by the ball is measured and shall not exceed 2 mm.

- **Resistance to flame propagation (needle flame test)**
This test is carried out in according to standard EN 60695-11-5 at the following conditions.
The test is made on two sets of samples whose length is about 675 mm.
The sample is placed vertically with its lower extremity about 100 mm above the tissue covered pinewood board, in a rectangular metal enclosure with an open face.
It shall be securely fixed to a rigid support through the fixing holes, in the base of the trunking .
The burner (needle flame) is positioned on the sample in such a way that the axis forms an angle of about 45° with the horizontal one, and the flame is applied centrally to the boundary of an opening of the wall approximately 200 mm above the wrapping tissue covered pinewood board, the end of the burner tube being distanced 5 mm from the sample.
The test is repeated but with the burner applied to one extremity of the cover.
The sample is subjected to the exposure of the flame for 60 s each time.
The sample is regarded as having passed the test if:

●

it does not ignite ; or if

●

in the case of ignition, the flames or glowing of the sample extinguish within 30 s after removal of the test flame and there is no ignition of the wrapping tissue or scorching of the pinewood board.
- **Fire hazard**

●

Compliance is checked by glow wire test in accordance with the standards EN 50085-1 and EN 60695-2-11.

Symbols

In circuit diagrams, the following symbols have been used as minimum:

Clamp	
Test Socket connection	
Resistor	
Diode	
Bipolar LED	
Fuse	
Neon Lamp	
Ground	
Moveable Link	
Sliding Connection	
Disconnectable	
Cross Connection/ Bridge Comb	

The applicability of test sockets are shown in the schematic diagrams of only test/disconnect terminal blocks, for its usage on other terminal blocks, refer to related descriptions..
